14 → 6

places to launch
one app

Claude skills
that do it for you

I launched my app on 14 sites in 3 days. Then I turned it into skills.

Here's what I learned

THE PROBLEM

Every site has its own rules. I learned them the hard way.

Product Hunt gallery
1270×760

Dev.to cover
1000×420

Hashnode cover
1600×840

MacUpdate icon
512px PNG, transparent

r/macapps
PCP format, once every 30 days

Dev.to
canonical in Advanced Options

THE SURPRISE

New accounts can't launch.

Hacker News	Show HN from a new account lands on `/showlim`
Indie Hackers	Posting is for established members only
r/macapps	10 karma earned inside the subreddit first

> "overrun by AI slop submissions which took all the joy out of doing it."
>
> awesome-macOS, closing public submissions the day before I got there

THE IDEA

A skill is a folder your agent loads on its own.

Instructions plus scripts. You don't call it by name: you say **"add my app to awesome-mac"** and the right one loads.

```
skills/launch-lists/
├── SKILL.md # rules and steps
└── scripts/
    ├── insert-list-line.py
    └── add-json-entry.py
```

THE SIX SKILLS

One launch, six jobs.

launch-kit
Copy and every image size, from your project

launch-cross-post
Dev.to, Hashnode, Medium, canonical to your blog

launch-lists
One PR per awesome list

launch-directories
AlternativeTo, MacUpdate, Indie Hackers

launch-community-drafts
Show HN, Reddit, Product Hunt drafts, rule-checked

launch-tracker
Every channel, status and link

THE RULE

It does the work. You press publish.

```
› add JUMP to awesome-mac
✓ List still accepts public PRs
✓ No duplicate PRs found
✓ Category: Productivity
✓ 4 READMEs, 1 line each
? Open the pull request? (y/n)
```

Sign-ins, CAPTCHAs and payments stay yours.

TESTED

Not vibes. Tests. byte for byte

25

unit tests for the scripts

10/10

eval graders passing with `claude plugin eval`

each script, run on my real launch, matched what I had published by hand

TRY IT

Open source. Free. MIT.

Install in Claude Code

```
/plugin marketplace add alvaldes/launch-skills
```

```
/plugin install launch-skills@launch-skills
```

Or copy `skills/` into any agent that reads SKILL.md

→ github.com/alvaldes/launch-skills

→ alvaldes.dev/blog

Launching something? Tell me where it worked.
